

What's MACE Edit?

MACE Edit is a utility intended to help iTunes U administrators design and manage their iTunes U credentials. Using MACE Edit, you can create and save credentials and edit them later. For example, you might create a set of credentials for your school's fall semester, save those credentials, and re-edit them for spring semester..

In addition, MACE Edit provides you a GUI mechanism for designing and editing iTunes U MACE URNs. Using MACE Edit, you create a set of tokens which can be inserted and rearranged in a special "token field". When you're done placing tokens the way you'd like in the token field, MACE Edit will automatically generate a properly formatted MACE URN which can be copied and pasted into iTunes. Modifying a URN is simple: just drag and drop tokens.

Finally, MACE Edit gives you a way to search through a large set of MACE URNs or find a specific credential. For example, you might want to locate every URN with the string "chemistry" in it.

Documentation?

MACE Edit is a very new project. I will try to get you complete documentation as quickly as possible.
